Nexis Series high efficiency depth filter cartridges are constructed using an advanced, microprocessor controlled CoLD Melt™ production process that permits the creation of multiple filtration zones within a single filter cartridge. The multi-zone design produces a gradient pore structure that effectively captures large particles in the outer sections of the filter cartridge while providing highly efficient and consistent removal of smaller particles in the inner sections.

CoLD Melt fiber technology has been selectively integrated into critical zones of the Nexis filter to enhance the retention, efficiency and mechanical strength of the cartridge. The interlocking and thermal bonding of support fibers with ultra-thin filtration fibers creates a rigid filter matrix that withstands dynamic operating conditions.

An initial flush is recommended prior to use.
